Lab: Connect to Db2 database on Cloud using Python

1 Introduction

This notebook illustrates how to access DB2 Warehouse on Cloud using Python by following the steps below: 1. Import the ibm_db Python library 1. Enter the database connection credentials 1. Create the database connection 1. Close the database connection

Notice: Please follow the instructions given in the first Lab of this course to Create a database service instance of Db2 on Cloud and retrieve your database credentials.

1.1 Import the ibm_db Python library

The ibm_db API provides a variety of useful Python functions for accessing and manipulating data in an IBMő data server database, including functions for connecting to a database, preparing and issuing SQL statements, fetching rows from result sets, calling stored procedures, committing and rolling back transactions, handling errors, and retrieving metadata.

We first import the ibm_db library into our Python Application

Execute the following cell by clicking within it and then press shift and enter keys simultaneously

```
In [ ]: import ibm_db
```

When the command above completes, the ibm_db library is loaded in your notebook.

1.2 Identify the database connection credentials

Connecting to dashDB or DB2 database requires the following information: * Driver Name * Database name * Host DNS name or IP address * Host port * Connection protocol * User ID (or username) * User Password

Notice: To obtain credentials please refer to the instructions given in the first Lab of this course Now enter your database credentials below

Replace the placeholder values in angular brackets <> below with your actual database credentials

```
e.g. replace "< database >" with "BLUDB"
```

```
dsn_hostname = "<hostname>" # e.g.: "awh-yp-small03.services.dal.bluemix.net"
dsn_port = "<port>" # e.g. "50000"
dsn_protocol = "" # i.e. "TCPIP"
dsn_uid = "<username>" # e.g. "dash104434"
dsn_pwd = "<password>" # e.g. "7dBZ3wWt9XN6$o0JiX!m"
```

1.3 Create the DB2 database connection

Ibm_db API uses the IBM Data Server Driver for ODBC and CLI APIs to connect to IBM DB2 and Informix.

Lets build the dsn connection string using the credentials you entered above

```
In []: #Create the dsn connection string
    dsn = (
        "DRIVER={0};"
        "DATABASE={1};"
        "HOSTNAME={2};"
        "PORT={3};"
        "PROTOCOL={4};"
        "UID={5};"
        "PWD={6};").format(dsn_driver, dsn_database, dsn_hostname, dsn_port, dsn_protocol, description of the connection string to check correct values are specified print(dsn)
```

Now establish the connection to the database

1.4 Close the Connection

We free all resources by closing the connection. Remember that it is always important to close connections so that we can avoid unused connections taking up resources.

```
In []: ibm_db.close(conn)
```

1.5 Summary

In this tutorial you established a connection to a DB2 Warehouse on Cloud database from a Python notebook using ibm_db API.
